```
A; Molecule type: protein
A; Residues: 1-179 (CH2>
C; Comment: This enzyme catalyzes interconversion of the cis and trans imino peptide b
C; Comment: This enzyme catalyzes interconversion of the cis and trans imino peptide b
C; Cyperfamily: peptidylprolyl isomerase; cyclophilin homology
C; Keywords: cis-trans-isomerase; cyclosportn A binding; cytosol; nucleotide binding;
F; 1-179/Domain: cyclophilin homology (CYP>
F; 81-88/Region: nucleotide-binding motif A (P-loop)
F; 31.712/Ending site: phosphate (Thr) (covalent) (by protein kinase II) #status predicted
F; 23/Ending site: phosphate (Ser) (covalent) (by protein kinase C) #status predicted
F; 23/Ending site: phosphate (Ser) (covalent) (by casein kinase II) #status predicted
F; 131/Ending site: phosphate (Ser) (covalent) (by casein kinase II) #status predicted
F; 132/Binding site: substrate (Thr) #status predicted
F; 132/Binding site: phosphate (Thr) (covalent) (by casein kinase II) #status predicted
F; 132/Binding site: phosphate (Thr) (covalent) (by casein kinase II) #status predicted
F; 172/Binding site: phosphate (Thr) (covalent) (by casein kinase II) #status predicted
F; 172/Binding site: phosphate (Thr) (covalent) (by casein kinase)
F; 172/Binding site: phosphate (Thr) (covalent) (by casein kinase)

PEPTIDYL-PROVE CIS-TRANS ISOMERASE (EC 5.2.1.8) (PPIASE) (ROTAMASE)
(CYCLOPHILIN) (CYCLOSPORIN A-BINDING PROTEIN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -1- ENZYME REGULATION: BINDS CYCLOSPORIN A (CSA). CSA MEDIATES SOME OF ITS BEFECTS VIA AN INHIBITORY ACTION ON PPIASE.
-1- SUBCELLULAR LOCATION: CYPOPLASMIC.
-1- TISSUE SPECIFICITY: UBIQUITOUS.
-1- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                           ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Blattella germanica (German cockroach).

GATALYTON. PPIAGES ACCELERATE THE FOLDING OF PROTEINS.
CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS. IN OLGOPEPTIDES.
C. ENZYME REGULATION: CYCLOSPORIN A (CSA) INHIBITS CYPB.
C. SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM LOMEN (BY SIMILARITY).
C. SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPIASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-APR-1990 (Rel. 14, Created)

-!- FUNCTION: PEPTIDYL-PROLYL CIS-TRANS ISOMERASES ACCELERATE THE
FOLDING OF PROTEINS (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC
PEPTIDE BONDS IN OLIGOPEPTIDES.

-!- SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PEPTIDYL-PROLYL CIS-
TRANS ISOMERASE FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a polypeptide encoded by one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or poly4 RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oilgo-dry primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rately included. 5' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic bnAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and
          This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

The invention relates to a composition for modulating somatclactogenic function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (cypB), a mutant of cyclophilin B (cypB), a mutant of cyclophilin B with a cypB mutant in which residues 2-12 of the mature protein are absent) or an inhibitor of the interaction of cyclophilin B with a somatclactogenic hormone (e.g., prolactin, growth hormone). The invention also relates to a method of identifying inhibitors of somatclactogenic functions using CypB and a somatclactogenic hormone, and a method for diagnosing diseases associated with ahormal somatclactogenic functions by assessing diseases associated with ahormal somatclactogenic functions useful for augmenting somatclactogenic function in the animal, and cyclophilin B with a somatclactogenic function in the animal. A composition of cyclophilin B with a somatclactogenic politic of in the treatment of somatclactogenic function in the animal. A composition comprising cyclophilin B with a somatclactogenic of in the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising cyclophilin B cyclophilin B cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B cyclophilin B mutant or a composition comprising cyclophilin B cyclophilin 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel composition for modulating somatolactogenic function, comprises cyclophilln B, its mutant or an inhibitor of interaction of cyclophilln B with somatolactogenic hormone ^{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human cyclophilin B; CypB; prolactin-binding; growth hormone-binding; somatolactogenic function modulator; immunosuppression; short stature; muscle wasting; osteoporosis; HIV infection; breast cancer; prostate cancer; gigantian; acromegaly; hyperprolactinaemia; C-terminal deletion mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human cyclophilin B (CypB) C-terminal deletion mutant, CypB-AIAKE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 211;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention retains to a composition to amountains, composition to accompanies to a composition of cyclophilin B (cybB), a mutant of cyclophilin B (particularly a CypB mutant in which residues 2-12 of the mature protein are absent) or an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone (e.g., prolactin, growth hormone). The invention functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic function in the animal, and cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic function in the animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for inhibiting sometimes are the solution of the animal. A composition comprising cyclophilin B is useful in the treatment of immunosuppression, in the treatment of short stature, muscle wasting and osteoprosis. A composition comprising cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone, is useful for treating HIV infection, breast and prostate sequence represents human cyclophilin B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel composition for modulating somatolactogenic function, comprises cyclophilin B, its mutant or an inhibitor of interaction of cyclophilin B with somatolactogenic hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a composition for modulating somatolactogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human cyclophilin B; CypB; prolactin-binding; growth hormone-binding; somatolactopentc function medulacto; immunosuppression; short stature; muscla wasting; osteoporosis; HIV infection; breast cancer; prostate cancer; gigantism; acromegaly; hyperprolactinaemia.

Include: cytostatic; proliferative; vulnerary; immunomodulator; antidathetic; coagulat; dermatological; neuroprotective; cardiant; thrombolytic; coagulat; nootropic; antipsoriatic and antidathetic; The proportion of polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune cells, to treat disorders of haematopoietic cells, autoimmune cells, to treat disorders of haematopoietic cells, autoimmune cells, to treat disorders or thrombolytic activity, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78451 and AAB4440 represent sequences used in the exemplification of
                                                                                                                                                                      diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral; antilhicamatory; antithyroid; antithyroid; antibaterarial; cardiant; dermatological; neuroprotective; thrombolytic; coaqulant; noctropic; vasotropic; antipscriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoietic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; heemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer \cdot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a cyclophilin including a tyrosine residue in the drug-binding site, and which is endogenous to the parasites onchocerca volvulus, Brugaia malayl, Dirofilaria immitis. The cyclophilin is useful for inhibiting the growth and development of parasites or for treating parasitic infections which are not susceptible to cyclosporin A. The purified 'tyrosine-containing' cyclophilin can be used to produce antibodies, either polyclonal or monoclonal, useful as probes to detect and/or purify related cyclophilins in other parasites.

This represents the amino acid sequence of cyclophilin (DdCyP2) from the Dictyostellum discoldeum Ax-2. The invention provides sequences encoding Dictyostellum DP1, human DP1 (hDP1) and Dictyostellum cyclophilln (DdCyP2) which are bisphosphonate inding proteins The invention also provides methods for purifying and producing such bisphosphonate binding protein. The bisphosphonate binding protein, or an antibody which binds protein can be used in the diagnosts of calcium metabolism disorders. They can also be used to treat calcium metabolism where the treatment is for the regulation of bone metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; prollferative disorder; wound; infectious disease.

The present sequence represents human cyclophilin D which is a mitochondrial core component. Cyclophilins interact with other mitochondrial core components e.g. adenine nucleotide translocator (ANT) to proteins to requiate MPT. ANT proteins are mitochondrial permeability translition (MTP) pore components responsible for mediating transport of ADP across the mitochondrial inner membrane. The present invention relates to a novel nucleic acid expression construct comprising a promoter operably linked to a polynucleotide encoding a mitochondrial pore component polypeptide (e.g. ANT) fused to an energy transfer molecule (ETM) protein (e.g. green fluorescent protein (GFP) or a FLASH sequence). The novel expression construct can alter mitochondrial membrane permeability transition and/or alter the interaction between mitochondrial core components. The methods are useful for screening for agents that alter MPT and/or cell survival. These agents are useful for the prevention or treatment of diseases associated with altered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mitochondrial function or dysfunctional cell survival, such as Alzheimer's disease, diabetes mellitus, Parkinson's disease, Huntington's disease, schizophrenia, mitochondrial encephalopathy, lactic acidosis, stroke, hyperproliferative disorders e.g. cancer, and deafness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination; sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAPI5566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB55363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antilnfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pollmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The method involves detecting the presence of a cervical cancer associated protein (CVC) in a tissue or body fluid sample. The CVC is characterised as having a molecular weight of 4400-69400 Daltons as determined by sodium dodecyl:sulphate (SDS)-PAGE techniques and an isoelectric point (PI) of 5.1-6.6 as determined by standard isoelectric focusing techniques. The protein is further characterised as being a non-chromatin protein which is detectable at a higher level in a human cervical cancer cell than in a normal human cervical cell, as determined by 2D-gel electrophoresis. The methods can be used for the early and rapid detection of cervical cancer, for treating cervical cancers and for monitoring the efficacy of such treatment.

peptidylprolyl isomerase (EC 5.2.1.8) A - rat
N'Alternate names: 13.3K protein [misidentification]; cyclophillin A; cyclosporin A-bi
C;Species: Rattus norvegicus (Norway rat)
C;Accession: A28192 #sequence_revision 31-Mar-1992 #text_change 04-Feb-2000
C;Accession: A29819; A60036; A15632; A58859
DNA 7, 261-267, 1988
A;Title: plabls: A cDNA clone of the rat mRNA encoding cyclophillin.
A;Reference number: A29819; MUID:88283345
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A:Molecule type: mrna

peptidylprolyl isomerase (EC 5.2.1.8) A - Chinese hamster
peptidylprolyl isomerase (EC 5.2.1.8) A - Chinese hamster
N'Alternate names: cyclophilin A; cyclosporin A-binding protein A
C; Species: Cricetulus griseus (Chinese hamster)
C; Date: 31 - Mar-1992 fsequence_revision 31-Mar-1992 ftext_change 16-Jul-1999
C; Accession: 807597
R; Bergsma, D.J.: Sylvester, D.

C; Cross-references: EMBL:X17105; NID:q49495; PIDN:CAA34961.1; PID:q49496
C; Function:
A; Description: catalyzes the cis-trans isomerization of peptidylproline peptide bonds
C; Superfamily: peptidylproly isomerase; cyclophilin homology
C; Keywords: cis-trans-isomerase; cyclosporin A binding; T-cell
F; 3-164/Domain: cyclophilin homology <CYP>
